Alexandru Averian, *Digital Ecosystems Software Modeling from a Niche Perspective*

**Abstract**

A digital ecosystem is a new technical-social networked platform and collaborative environment derived from properties observed in natural ecosystems. Such properties as openness, loosely-coupling, auto-organizing and niche oriented could be used to design new type of applications. In this paper we provide an ecosystem model implemented as a multi-agent system from a niche based perspective. We are introducing the concept of niche from a philosophical perspective and then provide a definition of fundamental and realized niche.

**Keywords:** digital ecosystem, digital species formal context, self-organization multi-agent systems
